AO3 Contextual Tagging: Misuse vs. Interpretation

Introduction

Archive of Our Own, known and referred to in this paper as AO3, is a non-profit fanfiction website created by writers to archive fan creations. In the early days of the internet, fanfiction was scattered across various platforms that were not designed to host fanworks, leaving them vulnerable to deletion due to copyright claims, policy changes, or advertising conflicts. F*anfiction.net* was the first website dedicated solely to fan works, but it was "purged" around 2008. Unfortunately, this disproportionately affected queer content; in response to growing restrictions across platforms, members of the fan community launched AO3 in 2009 as a space with fewer limitations. One of the features that quickly set AO3 apart was its robust, user-generated tagging system, a defining element of the platform's culture and functionality.

Tagging History

Tagging systems have been around since the early days of the internet through online bookmarking systems, but the specific web service *de.lic.ious,* which began in 2003, first coined the term tagging. After that, Scott A. Golder and Bernardo A. Huberman released one of the first published articles defining tagging as the practice of allowing authors to freely attach keywords or tags to content.[1]

My Angle

The main goal of this research paper is to analyze how tagging on Archive of Our Own (AO3) is used as a rhetorical tool that varies within different communities. I will explore how tags are used to shape expectations and structure engagement and how community rhetoric has influenced tag meaning and usage between different fandoms. Drawing from data gathered on the website itself and discussions on other applications, I aim to investigate the discourse behind consent expectations throughout AO3. This will allow me to define tag misuse and rhetorically examine how the AO3 cultural narrative affects tagging practices.

Background Information

Importance of Tagging

Tagging with regards to fanfiction specifics was used in a different way on fanfiction.net. Unlike AO3's open-ended system, fanfiction.net used tags in a more formal, restrictive way. However, fanfiction.net's filtering system[2] was a major influence on the development of AO3's more flexible tagging structure.

The limitations of fanfiction.net also led to one of the first instances of a rhetorical tag used throughout communities: The citrus scale. Due to fanfiction.net's restrictions on explicit content, the site did not allow users to openly tag works as explicit, which meant readers had little warning about the content they might encounter. To combat this, the community introduced the

idea of stating what content was expected through code. “Orange” signaled mild content (kissing, cuddling, etc.), “lime” indicated slightly more mature content, and “lemon” denoted explicit sexual content. There was also a fourth fruit, “Grapefruit,” which signaled explicit, possibly disturbing content. This unofficial system laid early groundwork for the kinds of community-driven tagging seen on AO3, reflecting fans’ priorities around consent, content warnings, and creative freedom.

Tagging Information

To understand the rest of the research, it's important to have a basic understanding of how tagging works within AO3. When posting an original work, the author is prompted to include tags. There are seven different types of tags: Ratings, Warnings, Categories, Fandoms, Characters, Relationships, and Additional Tags. The first 3 types are limited; unlike the rest, there is a specific set of tags to choose from. For example, categories have the options of Gen, F/M, F/F, M/M, Multi, or Other. These are referring to the orientation of relationships appearing in the work, Gen meaning no romantic relationships. The only required tags when posting are the Warnings tags. However, most fics will include at least one tag in each category. A fic can have up to 75 different tags as of 2021, and each tag can be up to 100 characters. [3]

Tags are the foundation of AO3’s success because they are the way readers can find fanfics and choose which ones to read. They do this by using the built-in filtering system that works by allowing you to include and exclude different tags. This means that readers can get specific results that match what they are looking for. The filtering capabilities of the website also extend to language, word count, completion status, the last date the fic was updated, and whether or not it is a crossover with another unrelated fandom. There is also the option that searches all fields associated with a work within the database, including summary, notes, and tags. While it's slightly less common to use this method because it requires a basic code structure, it greatly increases the possibilities of filtering.

Categories

I previously mentioned that three out of the seven tag categories are limited; the rest of the categories have virtually no limit on what the tag has to be. The exception to this is that no tag can include a comma because it is what is used to separate each individual tag.

There is a general format used for the additional categories (excluding freeform) that allows tags to be readable to most audiences. This is an example of rhetoric I will examine further later, because while there is no explicit rule, it is generally expected and assumed that you follow the specific formatting. For example, within the relationships tag, it is known that “&” refers to a platonic or familial relationship, while “/” implies a romantic one. When inputting tags on a fic to be posted, there is a drop-down menu that displays tags that already exist. This and the expected formatting system allow authors within the same community to use the same tags.

While the system works fairly well, there are many situations where exceptions have to be made for specific tags. Each tag has to belong to only one category, meaning that some tags have to be more specific than others. An example used on the AO3 FAQ is Buffy the Vampire Slayer being used as a fandom tag, so if someone tries to use it as a character tag, it will be changed to Buffy the Vampire Slayer - Character.[3] Situations like this are where Tag Wranglers come in; Tag

Wranglers are volunteers who go through and fix discrepancies like those shown above. They are also in charge of organizing parent tags, which are tags that act as an umbrella term for multiple other tags. I will talk more about the rhetoric of tag wrangling and what it means for the site as a whole later.

Freeform Tags

One of the most interesting factors that has come from AO3 is the community-specific tags. The rhetoric behind the tags is complex and changes throughout fandoms. Some tags are used almost globally throughout the site, for example, “hurt/comfort,” “Slow Burn,” “crack treated seriously,” and “fluff.” The most interesting part of these is how they were created and used very specifically for fanfiction, and in many of their cases, AO3 itself. For example, while "Slow Burn" has been used as a phrase for decades, its use of describing how fast a romantic relationship is progressing in a story is almost singularly on AO3. Even more interesting are the differences between fandoms' definitions of "Slow Burn", which brings me to my first research question.

How do the meanings and rhetorical functions of specific tags shift across fandom contexts?

In answering this question, I aim to explore how different fandom communities on Archive of Our Own (AO3) interpret, adapt, and deploy tags according to their own cultural norms and expectations. I plan on doing this in a data-centered way, focusing on a specific, widely used tag to gain context for the overarching rhetoric behind community tagging. Within this exploration, I hope to answer a secondary question: **What defines misuse of a tag, and where does that misuse fit into AO3’s community values?** This will help guide me in my analysis of the first and main research question, while also examining the community norms of AO3.

Methodology

To answer my research question, I am going to focus on the tag “Slow Burn.”.Due to its nature, surrounding media, and stories, it does not have a firm definition even outside of fanfiction. Its usage varies depending on the context, but overall, it can be defined as a slow buildup[4], as that is the commonality between definitions. However, even within the narrower community of fanfiction, “Slow Burn” cannot be defined resolutely. These rhetorical differences in definitions between fandoms are what I hope to show and analyse.

Tag Choice

I chose to focus on the specific tag not only because of its overarching rhetorical uncertainty, but also because of its widespread usage throughout AO3. “Slow Burn” is defined under the parent tag “Slow Build,” meaning that every work tagged “Slow Burn” is also default tagged "Slow Build" due to its status as the parent. I am specifically going to focus on the first because, unlike “Slow Build,” it has a less-defined meaning, and is used more often; out of the 418,766 works tagged “Slow Build,” 371,325 of them are tagged “Slow Burn.” In the subset of cases, the author specifically chooses to tag "Slow Burn" instead of "Slow Build," which I feel is an important enough distinction that I will only be focusing on those tagged “Slow Burn.”

Another reason I chose this tag is because of the linked association between the tag and a fanfiction length. For many, including myself, this tag inherently suggests a longer and more built-up story. This means, through hard data, we will be able to see a clear indication of what

works different fandoms might consider long enough to be tagged “Slow Burn.” With this data, I plan to be able to grab outliers and more closely rhetorically examine specific works for why they were tagged, and what defines "Slow Burn" for the author of said work.

Fandom Choice

AO3 keeps track of the top fandoms in different categories. The categories consist of: Anime & Manga, Books & Literature, Cartoons & Comics & Graphic Novels, Celebrities & Real People, Movies, Music & Bands, Other Media, Theater, TV Shows, Video Games, and Uncategorized Fandoms. Because many fandoms belong to several different categories, I chose at least one in each category.

I excluded “Uncategorized Fandoms and Theatre, because the top fandoms in those categories did not have enough works for me to feel they would provide accurate data.

Because my research is specific to different fandom communities, I chose to exclude the Real People overarching category because it is a parent tag to both Sports RPF and Music RPF. I also feel it's important to collect data from fandoms with a more specific demographic. This left me with 20 fandoms.

To accurately get data on the average length of a work tagged with "Slow Burn," I first wanted to gather the average length of a work for each fandom in general. I chose not to exclude those tagged slowburn in this data collection because I am aiming for the general average, and excluding the tag could alter the average.

To do this, I plan on picking a random 30 pages and collecting the work length data from every fic on each page. This should leave me with about 600 data points for each fandom. Knowing that the average length of a work varies dramatically through different fandoms[5], I will collect both a baseline un-tagged data set and one filtering for “Slow Burn.” This will allow me to compare and contrast the average lengths. I will then be able to analyse rhetorical differences more closely by using the extremes of the data.

Data Collection

Problems

AO3 is actively against large-scale data scraping. They are constantly vigilant to protect the community's data against the growing problem of data scraping for the training of AI. The community as a whole is concerned about fan works being used in this way. AO3’s continuous defenses are proof of their respect for the community and their priority to keep fan works within their systems.

One of the ways AO3 recommends keeping your works from being scraped is by restricting works. Which means the author can prevent the work from being viewable to anyone not logged in with an account. This is one of the reasons why I spent so long making sure that I was collecting data while logged in through my code. Data without the restricted works would be incomplete.

On the other side of this is the fact that I myself was attempting to data scrape the site. AO3 themselves state -

> “We do not make exceptions for researchers or those wishing to create datasets. However, we don't have a policy against responsible data collection — such as those done by academic researchers.”[6]

So while I am not going against their policy, the self-described “technical measures” also affected my attempts. AO3 does not make their anti-scraping measures public for obvious reasons, so my workarounds were semi-effective.

This meant my data collection took much longer than expected, and had many more obstacles than if I were scraping a baseline site.

Initial Work

To begin collecting data, I first needed to create a program that would be able to access AO3 and scrape data from the fandoms chosen. I used Python to create the code, and at first, I was planning on using *Selenium*[7], which is an automated browser controller. However, Selenium's usage of a browser meant it ran slower and had a harder time dealing with exceptions that came up. I ended up using a combination; *Selenium*, to log in and gather header and cookie data, then *Requests*[8] to access the fandom links while still logged in.

Unfortunately, as described above, AO3 has many anti-scraping systems in place. This meant that while I was usually able to load and gather data from about 5 pages at once, the site would detect that I was accessing pages too fast and restrict my access. To get by this, I used an exponential delay method, which did work, but increased the time it took to gather data by a lot.

I also discovered that it was much faster to copy the entirety of the work data, instead of searching in the source code for the specific word count for each work. This meant I also had to create a code that would take the source text and find the word count for each work, but this proved much faster than searching while the page was loading, it also prevented problems with loading speeds.

Data Collected

AO3 only allows access to the first 5000 pages of works in larger fandoms; this is due to the large quantity of works. To gain access to the rest, you must filter down to a more specific search. Unfortunately, because half of the data AI was collecting was an unfiltered baseline, I had to decide what “sort by” system I would use. This is because if I left it as the default, which is sorting by date updated, older works would be left out due to the page limit. I decided to sort by Kudos, as I felt I was gathering data on a fandom's feelings as a whole, and fandoms that are more liked would therefore align at least slightly more with the community's viewings as a whole. This was not a problem for fandoms with less than 100,000 works, and for the data collected when filtering for “Slow Burn,” but I still chose to sort by kudos to keep things consistent.

Another important factor was that I decided to look at completed works only. If I had not excluded incomplete works, much of the data would be inaccurate because an author might be planning on making a longer fic, thus the tag, but not have finished.

After collecting and scraping the data using Python, I converted it to a CSV file and used Google Sheets to interpret the data.[9]

Statistical Data Analysis

After collecting the data, I was left with 20 fandoms worth of data, with an unfiltered dataset and a filtered dataset for the tag "Slow Burn." With the assistance of my helper code, I was able to gather word count data from each fandom, a non-tagged baseline, and a “Slow Burn” comparison. On average, I collected about 545 data points for each.

To evaluate how the meanings and rhetorical functions of how the “Slow Burn” tag shifts across fandom contexts, I conducted multiple statistical analyses comparing fanfiction word counts across fandoms, with and without the "Slow Burn" tag. These tests aimed to first confirm whether “Slow Burn” tagged works are generally longer, and then whether the extent of that lengthening varies significantly by fandom, thus implying that the meaning and usage of the tag shifts throughout fandoms, allowing me to pinpoint more specific data to rhetorically analyse individually.

Assumption

First, I must confirm my implied assumption: that “Slow Burn” works are, on average, longer. A paired t-test was performed comparing the average word counts of "Slow Burn" versus baseline works across 20 fandoms. Results showed that "Slow Burn" works are significantly longer on average (mean difference = 39114 words, $t(19) = 12.85$, $p < 0.001$, 95% CI [32,743.58, 45,485.00]).[16] This supports the assumption made when gathering data that “Slow Burn” implies a longer word count due to increased narrative arcs. However, this test doesn't inspect differences between individual fandoms, which is the overall research goal.[17]

Variation

My next goal is to help answer my research question by proving that "Slow Burn" works are more varied in length than my baseline test.

To do this, I conducted two separate ANOVA tests. One for works tagged "Slow Burn" and one for baseline works. The ANOVA for “Slow Burn” tagged fanfics revealed a highly significant effect of fandom on word count ($F(19, 10898) = 21.9$, $p < 0.001$)[18], indicating that average lengths of “Slow Burn” works differ substantially across fandoms. In contrast, the ANOVA for baseline works also yielded a significant result ($F(19, 10805) = 5.96$, $p < 0.001$)[18], but with a smaller F-value and lower variation, suggesting that untagged works vary less across fandoms in terms of length. You can see this visually through the box plot depicted. [19]

The expected variation of "Slow Burn" was standardized and universally applied throughout communities would be much closer to the “baseline” variation. Instead, it reflects different rhetorical expectations and storytelling standards depending on the fandom. For example, some fandoms may interpret “Slow Burn” as requiring a 50,000-word romantic arc, while in others, a much shorter work may still satisfy "Slow Burn" conventions.

Differences

The final test I conducted was to measure whether the actual average differences between baseline vs Slow tagged works in a fandom were statistically significant. The final test is asking as a whole if "Slow Burn" as a tag affects work length enough to prove statistically significant. To

do this, I calculated the word count difference for each fandom and ran a one-sample t-test. This will show directly whether "Slow Burn" itself has a consistent rhetorical meaning within fandoms. The results again showed strong significance ($t(19) = 14.41$, $p < 0.001$)[20], with a mean difference of 348 words, 95% CI [297.64, 398.80], and a standard deviation of 108.08. The range of differences spanned from 193 to 562 words, demonstrating considerable inconsistency in how much “Slow Burn” increases story length depending on the fandom.[21]

Analysis

Taken together, these findings strongly support the idea that the rhetorical function and interpretation of the "Slow Burn" tag are not fixed, but shift across fandom communities. While the tag reliably signals longer stories in general, the degree to which that increase occurs varies significantly, and thus what “Slow Burn” means in practical, narrative terms. This reflects underlying differences in fan community norms, genre conventions, and storytelling expectations, revealing the "Slow Burn" tag as a flexible rhetorical tool shaped by its fandom environment.

Tag misuse

Tagging works as a rhetorical tool to describe and define, but due to language's inherent evolution over time, and the context of a work changing, the meaning behind tags cannot stay stagnant.

We can see this same effect in another form of online tagging: social media hashtags. Both hashtags and AO3 tags began as tools to sort content, but have evolved into rhetorical devices—forms of metacommentary that create deeper community meaning than a straightforward, functional tag like a character name, which carries little interpretive weight compared to something like "Fluff."

“What a ‘metacommunicative tag’ does is more important than what it is. Their meaning lies with their function, not their form. ” - *Rhetorical Functions of Hashtag Forms Across Social Media Applications*[10]

This means identifying tag misuse for denotative functional tags is much easier; completed vs incomplete, for example. But within the specific context of AO3, there are no set-in-stone definitions, leaving consensus up to the people. This means even for seemingly clear tag categories, like relationship types, there are different community tagging practices.

In the Reddit thread “R/AO3 on Reddit: Unsure how to tag this sort of relationship?”[11] We can see community discourse over this specific topic, the question is referring to a story where the main characters do not get together, but instead subtext is meant to define their relationship in an “unknown” way. The comments are advising the initial poster with multiple different viewpoints, which in itself is showing the subjectivity of tags.

AO3’s strong emphasis on consistency means that throughout the community, authors try their best to fully describe their work in a way readers can comprehend and disengage from, if necessary. While we see this when it comes to content warning tags, this sentiment extends to freeform tags as well. This means there is not a large number of authors who intentionally misrepresent their works. I cannot state for a fact that it does not happen, but there is no consistent reason or representation of authors misleading purposefully.

Definitions

This leads me to my final definition of **tag misuse**:

Authors unintentionally using tags they themselves do not believe accurately describe their work.

Which allows me to define a second important term, **tag abuse**:

The deliberate use of tags to mislead readers about a work's content.

The key distinction between the two lies in authorial intent. If the author genuinely considers their work to be an accurate fit for the tag, then the tag is not misused. Fanfiction is storytelling, stories are art, and art is always open to interpretation.

This is why the rhetoric within communities changes the meaning of descriptive tags, and why AO3's community-agreed-upon rhetoric has been built over the years of online communication. As in cultural languages, there are still shifting meanings and standards.

Comparison Analysis & Discussion

Selection

When selecting specific works for in-depth analysis, I chose to focus on the median work length rather than the mean. While the mean was useful for the earlier statistical work, the median offers a better reference for the "typical" length of a work.

To decide which fanfiction works to analyze more closely, I began by identifying outliers. For instance, the fandom *Harry Potter - J.K. Rowling* has a median word count of 56,376 for works tagged with "Slow Burn," which, compared to the overall "Slow Burn" median of 27,902 words, is an increase of 102%.

In contrast, the "Slow Burn" rate for the fandom *Genshin Impact (Video Game)* shows a 45% decrease from the overall median, placing these two fandoms at opposite ends of the spectrum in terms of how the "Slow Burn" tag correlates with work length.

To choose which specific works within these fandoms to analyze, I aimed to find examples as close as possible to each fandom's typical word count. I used Archive of Our Own (AO3)'s search and filtering tools to locate works that approximated each median.

It's important to acknowledge that, from this point forward, the dataset may be slightly skewed due to a personal boundary: I chose to exclude any works labeled as Explicit, as I planned to closely read and analyze the selected texts. This meant that although I identified the median-length works, I chose alternatives near the median that fit within my boundaries.

Ultimately, I selected one work each from *Harry Potter - J.K. Rowling[22]* and *Genshin Impact (Video Game)[23]*. Each work's word count fell within a 10% increase or decrease of the fandom median. To minimize variables like language and tag development, both works were written within a year of each other (2023–2024), and both featured a mixture of dark and light themes.

To refer to the authors and works as little as possible, I will refer to *Harry Potter - J.K. Rowling* as "HP" and *Genshin Impact (Video Game)* as "GI."

Consent

Although AO3 was founded on the idea of freedom of content, the importance of consent is also built into the website. The fact that while you have a choice for all other tag categories, it is required to state explicitly what warnings are in the work is a clear depiction of the expectation throughout AO3. The best example of this is the tag “Dead Dove: Do Not Eat.” This tag is a reference to an episode of Arrested Development, "Top Banana," from 2003. In the episode, the character Michael Bluth opens a paper bag found in a fridge labeled “DEAD DOVE DO NOT EAT.” When there is, in fact, a dead dove inside, he says, “I don't know what I expected."[12] The problem was that while many fics would include warning tags or content tags, the content in most fics tended to be a subversion of these tags. For example, something tagged “underage” might have a portion of the story take place while both characters are underage but overall not have any other related content. The tag serves as a way to inform readers that what is tagged is indeed correct. While technically this definition means it applies to any fanfiction where the tags are not understating the content, over the years, it has become more of a warning for graphic and disturbing material. This allows someone to easily filter and find content they do not want to see while allowing the website to remain unrestricted.

An important aspect of this is that consent goes from the reader to the author as well. In both of the analized works, the authors included a statement consenting to criticism. This is likely tied to ongoing discussions in the AO3 community about what is and isn’t appropriate to comment on. These conversations were sparked in part by fandoms gaining popularity through other social media platforms like TikTok. As fandom communities spread across platforms, customs can clash. What’s typical on AO3 may not align with expectations from users of sites like YouTube or Twitter. AO3 is an archive, not a social media platform, and creators do not profit from their work.

The prevailing sentiment is, “if you don't like it, don’t read it.”[13] This idea holds value for many authors and readers because it reinforces AO3’s founding values. Fanfiction is treated as a gift[14]; critiquing it, especially harshly, can feel like criticizing a present.

A common practice for authors who don’t want criticism is to delete negative comments from their works. For the most part, even in HP and GI, where the authors gave their consent to criticism, the comments avoid direct critique. One exception was a thread under the last chapter of GI that began with a plot critique and evolved into a respectful discussion between the reader and author.

Slow Burn

Both works are tagged “Slow Burn” and follow similar narrative paths, although the pacing in the shorter work is noticeably faster. In HP, “Slow Burn” applies not only to the relationship but also to the character-driven, heavier plot that focuses more on the protagonist than the romance. GI, in contrast, centers much more closely on the romantic relationship. It also takes place over a shorter in-story timeline, a few weeks versus HP’s years-long arc.

While both stories incorporate the kind of delayed romantic payoff typical of “Slow Burn,” their execution and pacing are significantly different.

Tags

Both works include content warning freeform tags such as “Suicide Attempt,” and “Terminal Illness,” but neither uses Archive Warnings. GI is tagged “No Archive Warnings Apply,” while HP is tagged “Creator Chose Not To Use Archive Warnings” and instead provides warnings in the author’s notes. The norm on AO3 is to give explicit content warnings, and many authors add additional notes at the start of each chapter. This practice acknowledges how important content warnings are to readers, even when authors want to avoid spoilers.

When it comes to freeform tags, we can see a greater display of rhetorical performance. HP uses several humorous and meta tags, such as “No war,” “No Werewolves,” and, “Remus has enough shit to deal with already without magic thrown in the mix.” This is a unique and relatively recent use of tagging that takes metacommentary to a new level. However, there is discussion that overuse of this “commentary style”[15] tagging reduces searchability and washes out more direct tags. These meta aspects also reflect fandom-specific quirks. For example, the tag “Venti Being a Little Shit (Genshin Impact)” appears on over 1,000 works, while the similar “Sirius Black being an Idiot” appears on fewer than 300, despite HP being a much larger fandom.

Discussion/Conclusion

This research study has shown that within AO3, tags are a rhetorical device used to inform readers about the content of a posted work. The rhetoric behind these tags is heavily influenced by both the overarching AO3 community and the specific fandom in which the work resides. By focusing specifically on the tag "Slow Burn," I was able to statistically demonstrate that fandom communities significantly impact the connotative meaning of a tag.

The similarities and differences between the compared works highlight how tag usage, narrative pacing, and reader-author interaction are embedded within the cultural and rhetorical norms of their respective fandoms. They also show how the broader AO3 community influences individual works through the shared values woven into the platform.

The evolving rhetoric of culture and language will continue to affect tagging practices. It’s important to approach the use of tags with an open mind, recognizing that not everyone interprets or applies them in the same way. Each fanfiction is shaped not only by the context in which it was written, but also by the environment in which it continues to exist. Just because a tag may have a specific meaning to one person doesn’t mean it holds the same significance for someone else within the diverse context of fandom communities.

The culture on AO3 is deeply rooted in the principle of consent; authors and readers alike prioritize mutual respect, with creators maintaining the agency to decide how their works are received, and readers being encouraged to engage in a way that respects these boundaries. This emphasis on consent shapes not only how feedback is given but also how works are tagged. Understanding the shifting rhetoric of tags within fandoms and respecting the culture of consent on platforms like AO3 is essential for fostering a more inclusive, communicative, and respectful community for both creators and readers.
